

COMICCRAFT

Viva Questions & Easy-to-Memorize Answers

AI Comic Story Creator Using Gemini Models

1. What is ComicCraft?

ComicCraft is an AI-powered web application that creates structured comic stories from a simple user idea. It uses the Gemini AI model to generate the story.

2. Why did you choose this project?

We chose this project to demonstrate how generative AI can be integrated with a web application to make creative storytelling easier and faster.

3. What problem does it solve?

Manual comic creation requires planning characters, scenes, dialogue, and the ending. ComicCraft reduces this effort by generating these elements automatically from a simple idea.

4. Why did you use Gemini?

We used Gemini because it is a generative AI model that can understand a user's story idea and generate structured creative content such as characters, chapters, dialogue, and an ending.

5. What is an API?

API stands for Application Programming Interface. It allows one software application to communicate with another. In our project, the backend communicates with Gemini through its API.

6. Why did you use FastAPI?

FastAPI is a Python web framework used to create the backend and API endpoints. It is lightweight, fast, and suitable for connecting our frontend with Gemini.

7. How does the frontend communicate with the backend?

The JavaScript in the frontend sends the user's comic idea to a FastAPI endpoint. The backend processes the request, communicates with Gemini, and returns the generated story to the frontend.

8. What is JSON?

JSON stands for JavaScript Object Notation. It is a lightweight format used to store and exchange structured data. Our generated comic is returned in a structured JSON format.

9. How is the comic story generated?

First, the user enters an idea. The frontend sends it to FastAPI. FastAPI sends a structured prompt to Gemini. Gemini returns the story as JSON, and the frontend displays the result.

10. How do you save comics?

Saved comics are stored in the browser's localStorage using the key 'comicCraftHistory'. The History page allows users to open or delete saved comics.

11. How does PDF generation work?

The frontend sends the comic data to the FastAPI PDF endpoint. The backend uses ReportLab to create a PDF document containing the generated story.

12. What is ReportLab?

ReportLab is a Python library used to create PDF documents. We use it in ComicCraft to generate downloadable PDF versions of stories.

13. What are the limitations of the project?

The project depends on Gemini availability and an internet connection for AI generation. AI image generation is not included in the current version, and saved history is stored only in the browser.

14. What happens if Gemini is unavailable?

The application displays an error message instead of a generated story. This can happen when the Gemini service is unavailable or when the API rate limit is reached.

15. What are the future enhancements?

Future enhancements could include AI-generated comic panels, user accounts and cloud storage, chapter editing and regeneration, multilingual support, more download formats, sharing, and collaboration.

16. Explain the complete system flow.

The user opens ComicCraft, enters a story idea, and submits it. The frontend sends the idea to FastAPI, which sends it to Gemini. Gemini returns structured story data. The frontend displays it, and the user can save, copy, or download the story.

17. What are the main modules?

The main modules are User Input, AI Story Generation, Character and Setting, Chapter Generation, Story Display, Comic History, Download, PDF Generation, and User Interface.

18. What technologies did you use?

We used Python, FastAPI, HTML, CSS, JavaScript, Google Gemini API, Jinja2, Uvicorn, JSON, and ReportLab.

19. How did you test the project?

We tested page loading, empty input validation, story generation, saving, opening and deleting comics, TXT download, and PDF download. The core browser features worked successfully.

20. Explain your project from start to finish.

ComicCraft is a web-based AI comic story creator. The user enters an idea, the frontend sends it to our Python FastAPI backend, and the backend sends a structured request to Gemini. Gemini generates the title, genre, characters, setting, chapters, dialogue, actions, and ending in JSON. The frontend displays the result, and users can save or download the story as TXT or PDF.
